

Automatic Execution Function

Function description

The Automatic Execution has the following function. If a predefined file consisted of user command sequences is downloaded to AddPac VoIP Gateway via FTP, AddPac VoIP Gateway can recognize this file as user command sequences. And this line-by-line command sequences will be operated automatically in the VoIP gateway.

The command sequences files for Automatic Execution Function must be downloaded via FTP protocol due to user authentication. The Automatic Execution Function does not support the TFTP protocol because of security issues.

In case configuration setting is very complex or routine procedure, the Automatic Execution Function is more useful and powerful than configuration setting via remote login.

The predefined file for Automatic Execution is consisted of CLI (command line interpreter) command sequences, and all CLI command sequences is started in configuration mode of CLI command level of AddPac VoIP gateway.

The Automatic Execution supports the short phrase command recognition features like normal command sequences except reboot and write command. The reboot and write commands need the whole command line syntax for system stability. This commands induces the system damage if incorrectly used.
